John:

My water ops guys have been in that area for the last couple of days and are still in general area. We have been reporting up locations of observed sheen and odors for the last couple of days in the sitrep updates. According to my guys, they have only seen varying degrees (thicknesses) of sheen, no tarry stuff or emulsified stuff. Some of the sheen areas have been pretty large. Odors have been mild to strong depending on the wind and size of sheen slicks. Please review water ops portion of the last couple of sitreps and see if we have provided enough info, if not let me know what else you need.

Warren

"Request (NRDA): please look into a report of an oil slick on the beach, 100+ miles west of the delta in Cocodrie, LA. Person with photos: Brandon Schuler (823) 603-3787"

And Derek said yesterday that we did not have to scan the logbooks everyday as long as the logbook SOPs are followed (scratching through a blank page after the end of the day's record. sign and date, neat penmanship, stays with the task functionetc). The logbook can be scanned at the end of the project or when full.
